

Omni-SOC 2026 ITDR Post-Incident Report

Date: May 1, 2026
Status: Neutralized
Target Identity: jason.n@omnicorp-cyber.com
Report ID: SOC-2026-ITDR-099

1. Executive Summary

This report details the automated detection and neutralization of a multi-vector identity-based attack simulation. The Omni-SOC 2026 platform successfully identified four distinct threat vectors—credential harvest, MFA fatigue, session hijacking, and Business Email Compromise (BEC)—executing autonomous remediation in under 1.5 seconds per event.

2. Threat Vectors Detected

- **Credential Compromise** : Detected `rundll32.exe` accessing browser credential stores, confirming an infostealer presence.
- **MFA Abuse** : Successfully mitigated 53 rapid-fire "Push Fatigue" authentication requests.
- **Session Hijacking** : Blocked "Impossible Travel" attempt (login sequence from London and Los Angeles within 5 minutes).
- **BEC/ATO** : Identified and purged unauthorized external forwarding rules injected into the mailbox.

3. Incident Timeline

Timestamp	Event	System Action
06:01:00	Credential Dump	Endpoint Isolation
06:01:15	MFA Fatigue Start	Auto-Suppression
06:02:00	Impossible Travel	Token Revocation
06:03:00	BEC Rule Injection	Rule Rollback

4. Final Outcome

All threats were autonomously neutralized. No sensitive data exfiltration occurred. The identity for **jason.n@omnicorp-cyber.com** has been fully restored after a password reset and security token refresh. The system achieved a 100% neutralization rate with zero manual operator intervention.
